What universal consistency explains about composition

Separate title page. Not a submission.

Author

Drew Lamarr Arrowood.
Affiliation: pending confirmation by the author. No institution, city, or country is invented here.
Corresponding email: pending confirmation by the author.
ORCID: not recorded.

Acknowledgements

Pending the author's text. None are invented here.

Funding and competing interests

Funding has not been confirmed. No funding statement should be inferred.

Competing interests have not been confirmed. No declaration of the absence of a conflict should be inferred.

Assistance

The review manuscript contains the assistance disclosure required in the manuscript itself. Grok Bot, a Cursor cloud agent, assisted with generative composition beyond copy editing. No tool version is recorded, and none is invented. The assistant is not an author. Human verification is pending.

Provenance

The finite canonical equivalence and the computational-basis witness are stated in an unpublished technical note by the same author and in other public drafts. The review copy does not name the author and does not give an address. Because those drafts are public, anonymity is not guaranteed. No submission has been made.

This article is about solvability under local replacement, as distinct from directed modularity. It is not the Mind draft on recombination, the Philosophy of Physics draft on spacetime embedding, or a submission of either.
