Succession is not a closed loop

A comparison of Turing's machines, Bennett's logical reversibility, and a later composition rule

Private identity sheet. The Elsevier guide for authors was not retrieved (access error). This sheet is not claimed to be a required submission file. The review manuscript omits the author's name as a precaution, not as a verified anonymity rule.

Author

Drew Lamarr Arrowood. Affiliation, email, and ORCID: pending confirmation. None are invented.

Funding and competing interests

Not confirmed. They are not written as "none."

Assistance

Grok Bot, a Cursor cloud agent, generated draft text beyond spelling checks. No tool version is recorded. The assistant is not an author. Human verification of the quotations against the printed pages is pending. Quotations were checked against text extracted from the PDFs named in the bibliography.

Sources and limits

Turing was read from the London Mathematical Society printing of the 1936 paper. The 1937 correction was not re-read and is not used. Bennett was read from the IBM Journal

printing of the 1973 paper. Landauer is present only as Bennett cites him; Landauer's paper was not re-read. No unpublished archive was consulted. No influence from Turing or Bennett to process functions is claimed. The finite mathematical statements are the same ones as in other public drafts by the same author. This manuscript is an alternative adaptation of that material to a historical question, not an independent study.

Submission

No submission has been made. Public drafts mean anonymity is not guaranteed.
