

Unique completion as a quantization condition
Draft. Not submitted.

(1) $o = f(w(o))$.

No solution is the grandfather case. Two is the bootstrap.

(2) $w(a,b,c) = (\text{not } b \text{ and } c, \text{ not } c \text{ and } a, \text{ not } a \text{ and } b)$.

(3) (o, e) maps to $(w(o) \text{ XOR } e, o)$.

(4) (i, s) maps to $(s, i \text{ XOR } w(s))$.

(5) some party disagrees in the output and agrees in w .

(6) $M \text{ M-dagger} = I$. Written, not kernel-checked.

Ordered functions embed as channels. Lugano does not.

The billiard has one continuation, two, or none.
