

Every process function lifts to a unitary process

Draft. Not a submission.

A process function has one fixed point for every local intervention. The 2019 paper added a source and a sink and left the quantum step open.

If two output strings differ, some party disagrees in the output and agrees in the function value. That party kills the off-diagonal.

Lean checked the lemma for any alphabet, and the bijection on bits. The complex contraction is written.

Embeddability

Post-selection is a simulation.

The source and the sink are
reversibility, not a metric.

Only a local flow on a fixed metric,
with one solution for every
intervention, is an embedding.

Two-party process functions embed
as channels in Minkowski spacetime.

Lugano does not. The billiard has
the wrong multiplicity. The cyclic
case stays open.
