Independent Operations, Dependent Histories

Private identity and declarations sheet

Draft, 8 November 2026. Not submitted.

This sheet is a workflow convenience. The excerpts of *Mind*'s instructions that were available do not establish that a separate title-page file is mandatory at initial submission, nor where an AI disclosure must sit relative to the ban on acknowledgements in the anonymized manuscript. Those placements are unresolved. This sheet is not a claim of submission compliance.

Author

Drew Lamarr Arrowood.

Affiliation: pending confirmation by the author. No institution or country is invented here.

Corresponding email: pending confirmation by the author.

ORCID: not recorded.

Acknowledgements

Pending the author's text. None are invented here.

Funding and conflicts

Funding: not yet confirmed by the author. No funding statement should be inferred.

Potential conflicts: not yet confirmed by the author. No declaration of the absence of a conflict should be inferred.

Assistance

Drafting, including organization of the argument and wording of the appendix, was assisted by Grok Bot, a Cursor cloud agent. The assistance included generative composition, not only spelling or reference formatting. No tool version identifier is established, and none is invented. The author's direction was the request for a separate *Mind*-format manuscript on operation substitution versus history dependence. The assistant is not an author. Human verification of the draft is pending and is not claimed here.

A neutral disclosure also appears in the review manuscript, because omitting it entirely would hide substantive assistance, while the correct initial-submission slot (cover letter, acknowledgements, or the anonymized file) was not verified.

Related manuscripts

The finite canonical-lift equivalence and the computational-basis witness also appear in unpublished drafts by the same author, including a technical note and drafts written toward other journals. This manuscript is a different argument. No submission of any draft is requested or recorded. Public drafts make anonymity insecure. The review copy cites the technical note in the third person, once, without an address. It does not pretend that an anonymized archive exists.

Anonymity audit, not a guarantee

Self-citation is one bibliographic entry, Arrowood (unpublished), among seven entries, and one in-text citation. That is under a quarter of the reference list and is not the most frequent author name in the review text. Further anonymization of the sort *Mind* requests when an author is the most-cited name, or exceeds a quarter of the references, is therefore not triggered by that count. The count does not make the author unidentifiable.
