# Operational validity is not a spacetime embedding

Private declarations sheet. Not a submission.

## Author

Drew Lamarr Arrowood. Affiliation: pending confirmation. Email: pending confirmation. ORCID: not recorded. No institution is invented here.

## Funding and competing interests

Not confirmed. No funding statement and no declaration of the absence of a conflict should be inferred.

## Assistance

Grok Bot, a Cursor cloud agent, assisted with generative composition of this draft, not only copy editing. No tool version is recorded, and none is invented. The assistant is not an author. Human verification is pending.

The journal page links to an AI policy that was not retrieved in full (the request timed out). A publisher-level LSE Press statement, adopting the COPE position of 13 February 2023, requires disclosure of AI writing tools in the materials and methods or a similar section. The review manuscript therefore contains an assistance section. Whether the journal requires a different slot remains unresolved.

## Provenance and anonymity

The operational equivalence and the computational-basis witness are also stated in an unpublished technical note by the same author, and in other public drafts. The review manuscript omits the author name and any address. The journal explicitly permits preprint deposit and warns that a public preprint can defeat anonymity. Anonymity is not claimed. No submission to the journal has been made. Society membership, required by the journal for submission, is not asserted.

## Related drafts

This argument is about operational validity versus spacetime embedding. It is not the Mind draft on operation substitution versus event recombination, and it is not a submission of the Foundations or Synthese drafts.
